Meteorologische
BEOBACHTUNGEN
an der
k. k. Sternwarte in Wien
von 1775 bis 1855.

Auf öffentliche Kosten
herausgegeben
von

CARL von LITTROW,
Director,
und
EDMUND WEISS,
Adjunct der k. k. Sternwarte.

Fünfter Band.
(1839–1855.)

Wien, 1866.
Druck und Papier von Leopold Sommer.
In Commission der Wallishausser'schen Buchhandlung (Jos. Klemm).

BIBLIOTHECA
REGIA
MONACENSIS.

Vorwort.

Die Anordnung der Beobachtungen ist im Anfange des vorliegenden Bandes dieselbe wie am Schlusse des vorhergehenden. Mit April 1841 beginnen die Messungen der Niederschläge. Vom 1. Jänner 1846 an wurde der Dunstdruck an einem nach Lamont getheilten Psychrometer (Annalen für Meteorologie und Erdmagnetismus 1842) bestimmt. Seit 27. Jänner 1846 wird die Windstärke auch im Originale nicht mehr wie früher mit: „still, schwach, mittel, stark, Sturm,“ sondern mit 0, 1, 2, 3, 4 bezeichnet. Vom Beginne des Jahres 1847 an war die erste Notirung jedes Tages um 6 Uhr statt wie bisher um 8 Uhr Morgens. Aus Versehen blieb im Drucke für die Monate: Jänner bis August noch die frühere Stunde in den Köpfen der betreffenden Rubriken stehen.

Der Stand des Barometers war durchaus, wie schon meistentheils in den vorhergehenden Jahren, 101.7 Wiener Fuss über dem mittleren Spiegel der Donau oder 98.05 Wiener Klafter = 95.41 Toisen über dem adriatischen Meere (Band III, Seite V, wo es in der Note auch besser 95.41 statt 95.39 hiesse). Um den Leser über diesen Punkt völlig klar zu machen, sei hier noch bemerkt, dass die Band IV, Seite V, als Wohnung des Adjuncten erwähnte Räumlichkeit später zum Rechenzimmer umgestaltet wurde, so dass der a. a. O. angegebene Aufstellungsort des Barometers mit dem in „Annalen der Wiener Sternwarte“, Neuer Folge, I. Band, Seite XLII, bezeichneten gleichbedeutend ist. Bei dieser Gelegenheit sei auch noch eine sonderbare Stilisirung derselben Stelle, Band IV, Seite V, verdeutlicht. Die dort aus dem Tagebuche von 1830 angeführte Note sagt nämlich, das Barometer stehe „101.7 Wiener Fuss über dem mittleren Spiegel der Donau, d. h. 4 Fuss über dem Nullpunkte an dem Mittelpfeiler der Franzensbrücke“. Damit ist gemeint, dass der mittlere Spiegel der Donau und nicht etwa das Barometer 4 Fuss über dem Nullpunkte des Pfeilers steht, wie man schon aus der oben citirten Stelle der „Annalen“ ersehen kann. Die Franzensbrücke wurde übrigens später

in eine Kettenbrücke verwandelt; der besagte Pegel existirt also nicht mehr.

In Bezug auf das zu den Luftdruckmessungen gebrauchte Instrument muss, theilweise als Ergänzung auch zu dem IV. Bande unseres Werkes, hervorgehoben werden, dass zu einer nicht mehr genau zu bestimmenden Zeit, aber beiläufig um das Jahr 1830, die Sternwarte ein von dem damaligen Professor der Physik in Prag, C. Hallaschka, angefertigtes Heberbarometer erwarb, das sie noch besitzt und bis 1848 zu den täglichen Notirungen benützte. Das Instrument ist sorgfältig gearbeitet und auf Pariser Zolle getheilt. Der Nonius ist bei beiden Niveaux durch Zahnwerk einzustellen und erlaubt schätzungsweise noch das Tausendtel des Zolles zu lesen. Die Einstellung geschieht durch Spiegelung der Quecksilberkuppen in einem an dem Nonius befestigten Täfelchen vom schwarzen Glase. Die Theilung, auf einer einzigen Lamelle aufgetragen, hat das Eigenthümliche, dass der Nullpunkt beiläufig in der Mitte der Quecksilbersäule sich befindet und daher die an den beiden Nonien gelesenen Zahlen erst addirt werden müssen, um die Länge der Säule über dem unteren Niveau zu erfahren. Offenbar wollte man damit den Fehlern vorbeugen, die aus einer Verrückung des Nullpunktes entstehen. Gegenüber solchem Streben nach Genauigkeit darf man sich billig darüber wundern, dass an dem Instrumente kein Thermometer angebracht ist.

Sicherlich schon von den ersten Dreissigerjahren an, wenn nicht noch früher, trat dieses Hallaschka'sche Barometer in Gebrauch für die laufenden meteorologischen Beobachtungen.

Im Jahre 1840 ergab sich durch Herrn Med. Dr. A. W. F. Schultz in Berlin, der auf einer Reise in Italien und Deutschland zwei Barometer von Pistor und Schiek mit sich geführt und an vielen Orten mit den Instrumenten, die zu meteorologischen Beobachtungen dienten, verglichen hatte (Monatsberichte der Gesellschaft für Erdkunde zu Berlin, Jahrgang 1840, Seite 53), und im Jahre 1841 durch ein Normal-Heberbarometer von Pistor, welches sich die hiesige Sternwarte anschaffte und das später an die k. k. Centralanstalt für Meteorologie abgetreten wurde, zuerst die Möglichkeit der Vergleichung mit fremden Barometern. Von da ab wurde immer für die Richtigkeit dieser Instrumente gehörig vorgesorgt, wie unter Anderem folgende schon in der lithographirten Uebersicht vom Jahre 1845 vorkommende Bemerkung beweist:

„Für das Barometer Hallaschka, an welchem bis 16. Jänner und vom 6. Juli bis Ende des Jahres beobachtet wurde, gelten folgende Correctionen:

erste Periode: Barom. Hallaschka — 0″.015 = Gefässbarometer der Berliner Sternwarte
zweite Periode: „ „ — 0″.006 = „ „

Die Differenz der Barometer Hallaschka und Hanaczik, an welchem letzteren die Beobachtungen vom 16. Jänner bis 6. Juli gemacht wurden, ist durch Rechnung berücksichtigt, so dass für diese Zeit die Correction des Barometers Hallaschka gilt."

Solche geringe Unterbrechungen, die durch Reparaturen am Instrumente bewirkt waren, abgerechnet, blieb das Barometer Hallaschka bis 1. Jänner 1848 in beständiger Anwendung. Mit diesem Tage trat das Barometer Weilhöfer ein, das schon im Jahre 1830 angeschafft, aber bis dahin am Meridiankreise benützt worden war. Im Jahre 1847 wurde zu diesem letzteren Zwecke ein Barometer von Kapeller erworben, und das Barometer Weilhöfer für die laufenden meteorologischen Notirungen in das Rechenzimmer (98.05 Wiener Klafter Seehöhe des unteren Niveau) gebracht, da das Barometer Hallaschka nicht mehr entsprach, namentlich die Glasröhre desselben in der Gegend der unteren Kuppe an Durchsichtigkeit sehr verloren hatte.

Das Weilhöfer'sche Instrument, welches noch gegenwärtig für die täglichen meteorologischen Aufzeichnungen dient, ist ein Gefässbarometer von durchaus guter Arbeit. Der Nonius, durch eine die messingene Fassung umschliessende ringförmige Schraube in dieser Fassung verschiebbar, erlaubt Tausendtel des Pariser Zolles zu lesen, und führt auf der Rückseite der Fassung einen, dem Nonius ganz ähnlichen Schieber mit sich. Das Absehen wird durch die oberen Kanten des Nonius und dieses Schiebers gebildet. Die Röhre hat bei 11 Millim. inneren Durchmesser. Die Einstellung auf das untere Niveau geschieht mittelst einer, am Deckel des Gefässes festen Glasspitze und durch eine am unteren Ende des Instrumentes angebrachte Schraube. Das Thermometer taucht mit seiner Kugel in das Quecksilber des Gefässes. Gleich von der ersten Zeit an, in der das Barometer Weilhöfer noch bei dem Meridiankreise verwendet wurde, brachte man an jede Lesung die Correction +0.″134, angeblich als Theilungsfehler an (wonach die betreffende Stelle in der oben citirten „Zeitschrift für vergleichende Erdkunde" zu verbessern ist). Am 8. November 1855 kam bei einer Reinigung des Quecksilbers Luft in die Röhre. Bei dem hierdurch veranlassten Auskochen änderte Hr. Kapeller den Nullpunkt der Scala so, dass jene Correction von nun an wegfiel. Am 12. December 1855 kam das Instrument zurück; in der Zwischenzeit und bis 3. Jänner 1856 wurden die Beobachtungen am Barometer Kapeller beim Meridiankreise angestellt, und diese Lesungen (eigent-

lich vom 8. November 2^h bis 31. December 1855 10^h incl.), wegen des um 18 Wiener Fuss höher gelegenen Standortes um +0.″020 corrigirt, sind hier abgedruckt.

Vor der eben erwähnten Aenderung des Barometers Weilhöfer betrug der Unterschied dieser beiden Instrumente für die gleiche Meereshöhe und natürlich nach Anbringung der obigen constanten Correction bei Weilhöfer:

Weilhöfer—Kapeller = +0.″026

Aus den gleichzeitigen Lesungen zwischen 12. December 1855 und 3. Jänner 1856 ergab sich nach jener Aenderung des Barometers Weilhöfer

Weilhöfer—Kapeller = +0.″041,

wonach folgen würde:

Weilhöfer I. Periode = Weilhöfer II. Periode — 0.″015.

Ausserdem existiren noch einige, im April 18 5, also vor der eben besprochenen Aenderung des Barometers Weilhöfer, und im März 1856, also nach jener Aenderung von Dr. Lukas mit einem Pistor'schen Barometer der k. k. Centralanstalt für Meteorologie angestellte Vergleichungen (Jahrbücher dieser Anstalt, III. Band, Seite 214). Allein die daraus folgenden Zahlen haben kein grosses Gewicht, da das Pistor'sche Instrument in der Zwischenzeit wesentliche Modificationen erfuhr.

Der Vollständigkeit wegen sei erwähnt, dass vom 9. August 1848 bis Ende 1852 der Luftdruck überdiess an einem Autographen notirt wurde, der jedoch vom 9. October 1848 bis 31. November 1848 und im März 1849 ausser Thätigkeit war. Die Resultate findet man in dem eben angeführten III. Bande der „Jahrbücher der Centralanstalt für Meteorologie". Bei der Vergleichung dieser Daten des Autographen mit den Lesungen am Barometer Weilhöfer kam Dr. Lukas auf zwei Ablesungsfehler im Originaltagebuche, die im Drucke hier corrigirt sind; sie waren:

1850 April 24 2^h Nachmittags 27.″438 statt 27.″348
1850 Dec. 29 6^h Morgens 27.474 „ 27.574.

Die Beobachtungen am Hygrometer wurden bis zum Jahre 1846 in derselben Weise fortgesetzt wie in den früheren Jahren. Dieselben scheinen übrigens nicht immer mit der nöthigen Sorgfalt angestellt, wie, abgesehen von jenen Angaben, bei denen das Hygrometer um ein oder zwei Zehntheile eines Grades höher steht, als das Thermometer, was bei ganz mit Wasserdampf gesättigter Luft als Ablesefehler sich leicht erklären liesse, grössere Diskrepanzen beweisen. So ist beispielsweise:

1839 October 17	10^h Abends	Thermom.	$+8.^\circ4$,	Hygrometer			$+9.^\circ5$
1841 Februar 10	2^h Nchm.	„	-2.4,	„			-1.7
1842 März 8	8^h Morgens	„	-2.2,	„			-1.0.

An folgenden Stellen haben wir das Zeichen der Hygrometerablesung ändern zu müssen geglaubt:

1842 Februar 28	2^h Nchm.	Hygrometerles.	$-3.^\circ8$	geändert	in	$+3.^\circ8$
1842 März 1	2^h „	„	-4.3	„	„	$+4.3$
1842 März 1	10^h Abends	„	-1.2	„	„	$+1.2$
1842 März 12	8^h Mrgs.	„	-1.7	„	„	$+1.7$
1842 April 13	10^h Abends	„	-2.8	„	„	$+2.8$
1844 Jänner 28	2^h Nchm.	„	-0.7	„	„	$+0.7$

Ebenso hätte wohl auch 1845 März 18 die Hygrometerlesung aus -1.4 in $+1.4$ verändert werden sollen.

Am 1. Jänner 1846 wurde an die Stelle des früheren Hygrometers ein neues eingesetzt, mit einer nach Lamont's Angaben getheilten Scale, an welcher von nun an direct der Dunstdruck abgelesen werden konnte. Am Ende des Jahres 1846 bemerkte man jedoch eine Verschiebung des nassen Thermometers an der Scala, und da sich nicht ermitteln liess, wann dieselbe eingetreten, wurden vom 1. Juli bis 31. December 1846 alle Psychrometerbeobachtungen gestrichen. Aus diesem Grunde sind auch die Beobachtungen der früheren Monate dieses Jahres nicht ganz zuverlässig, wiewohl es unwahrscheinlich ist, dass die Verschiebung schon in der ersten Hälfte des Jahres eingetreten sei.

An den Ablesungen des Maximum- und Minimum-Thermometers haben wir folgende Veränderungen vorgenommen:

1841 Februar 16 die Maximum- und Minimum-Lesung vertauscht.

1842 April 13	das	Minimum	aus	$-3.^\circ5$	verwandelt	in	$+3.^\circ5$.
1852 Febr. 7	„	„	„	-2.4	„	„	$+2.4$.
1854 Jänn. 31	„	„	„	-4.8	„	„	$+4.8$.

Ueberdiess scheint das Maximum am 10. Februar 1841 unrichtig zu sein.

Das Maximum- und Minimum-Thermometer wurde im Anfange der in diesem Bande enthaltenen Periode wie früher um 8^h Früh abgelesen, und zu dem vorhergehenden Tage geschrieben, so dass die betreffenden Zahlen für die Zeit von 8^h Mrgs. des Tages, bei welchem sie stehen, bis 8^h Mrgs. des folgenden Tages gelten. Als aber im Jahre 1847 die Beobachtungsstunde des Morgens auf 6^h verlegt wurde, nahm man auch die Ablesung des Maximum-Thermometers zu jener Zeit vor. Diese Praxis dauerte jedoch nur bis zum Jahre 1852 inclusive; vom 1. Jänner 1853 an ging man wieder auf 8^h als geeignetste Stunde für die Ablesung des Maximum-Thermometers zurück, die auch seither beibehalten wurde.

Das Maximumthermometer war übrigens in dieser Epoche nicht durchaus dasselbe. Die Sternwarte besitzt nämlich zwei derartige Instrumente, so wie zwei Lamont'sche Hygrometer, damit bei Reparaturen keine Unterbrechung der Notirungen eintritt. Solche Reparaturen wurden für das Thermometer nöthig 1846 Dec. 26 und 1853 Oct. 9.

Im April des Jahres 1841 wurde auf der Terrasse der Sternwarte in der Seehöhe von 102 Wiener Klafter ein Ombrometer nach Horner aufgestellt. Im Winter wurde die ersten Jahre der im Kasten des Ombrometers sich sammelnde Schnee geschmolzen, das Wasser sodann in das Ombrometer geschüttet, und durch die dabei erfolgenden Umschläge die Niederschlagsmenge bestimmt. Seit dem Winter 1846/7 stellte man eigene Schneegefässe auf, und mass zur Ermittlung der Niederschlagshöhe die Menge des erhaltenen Schneewassers. Das Schneewasser ist dem Regenwasser gegenüber im Drucke durch ein Sternchen (*) kenntlich gemacht.

Das Ombrometer wurde am Anfange der Periode um 8 Uhr Morgens, seit Jänner 1847 jedoch um 6 Uhr abgelesen, und es gilt hier dasselbe, was beim Minimumthermometer gesagt wurde.

Der kleinere Kreis des Ombrometers ist in 24, der grössere in 48 Theile getheilt, und es entspricht im Anfange der Periode bis Ende Januar 1846 eine Ausleerung der Regenhöhe von 0.200594 Par. Linien. Am 29. Januar 1846 wurde einer Reparatur wegen das Instrument abgeschraubt und durch ein neues ersetzt, bei dem ein Umschlag 0.12228 Par. L. beträgt. An diesem Instrumente wurde bis 3. März 1846 beobachtet, worauf wieder das alte in Gebrauch kam, bei dem jedoch von nun an bei 0.17885 Par. L. Regenhöhe ein Umschlag eintritt. Seit 1852 wird übrigens die Regenmenge nicht mehr in Ombrometer-Umschlägen gegeben, sondern dieselbe bereits in Regenhöhe reducirt angeführt.

Zur Reduction der Angabe des Schneewassers in Wiener Mass und dessen Bruchtheilen in Niederschlagshöhe diene die Bemerkung, dass ein Wiener Mass Wasser eine Niederschlagshöhe von 6.7521 Par. Lin. liefert.

In Bezug auf die Messungen des Niederschlags vom Jahre 1847 haben wir noch eine besondere Bemerkung zu machen. Bei der Ableitung der Anzahl von Umschlägen der Schale aus den Lesungen an den beiden Kreisen setzte der Rechner sonderbarerweise den kleinen Kreis auf 30, statt, wie es wirklich der Fall, auf 24 Theile getheilt voraus. Von einer Vertauschung des Instrumentes etwa mit einem auf 30 Theile getheilten kann keine Rede sein; überdiess kommt das ganze Jahr hindurch nie eine Lesung am kleineren Kreise vor, die grösser als

Unterbrechungen in der Notirung der Regenmenge kommen vor: 1842 October 14 bis 1843 Januar 6, wo die Terrasse der Sternwarte einem Umbau unterzogen und der Apparat deshalb abgeschraubt wurde; dann 1844 Juni 21 bis August 7, und 1851 März 17 bis April 1 wegen Reparaturen des Apparates. Ueberdiess war vom 18. März 1853 bis zum Schlusse des Monats das Schneegefäss zu Beobachtungen nicht tauglich, es sind daher die Angaben der Niederschlagshöhen am 20., 21., 24. und 28. März den Notirungen der Centralanstalt für Meteorologie entnommen.

Eine Vergleichung der auf der Sternwarte und an der meteorologischen Centralanstalt notirten Regenmengen zeigt, dass die letzteren viel bedeutender sind als die ersteren, was seinen hinreichenden Erklärungsgrund darin findet, dass die Entfernung des Ombrometers der Sternwarte vom Boden eine viel bedeutendere ist, als die jenes der Centralanstalt.

Neue Abkürzungen, welche nicht von selbst verständlich wären, sind nicht eingeführt worden; es kommen überhaupt nur mehr jene Abbreviaturen vor, die auch jetzt noch bei unseren meteorologischen Notirungen angewendet werden.

Einige besondere Notizen meteorologischen Inhaltes, die aus den Originaltagebüchern ausgezogen wurden, mögen hier noch ihren Platz finden.

1841 den 25. December wurde gegen 5^h 50^m m. Z. im Süden von W. nach O., vom Wassermanne durch den Walfisch gegen die Elektrisirmaschine bei 20° über dem Horizont, von Dr. Felber eine 5′ im Durchmesser haltende Feuerkugel von grösserer Helle als die der Venus im stärksten Lichte bei heiterem Himmel und halbem Mondlichte beobachtet. Aus dem westlichen Ende der Kugel schienen Funken wie aus einer Rakete zu gehen; der hieraus sich bildende Schweif war bei 15° lang und nahm die bogenförmige Richtung des Laufes an. Das Meteor ging gerade vor Mars und Deneb Kaitos vorüber und verschwand im Südosten. Geschwindigkeit beiläufig 15° in 1^s, ganze Dauer der Sichtbarkeit für den Beobachter 10^s, grösste Höhe über dem Horizont 25—30°.

Am 31. Juli 1842 um 7^h 31^m Abends wurde bei vollkommener Windstille ein starkes Schwanken des Mittagszeichen-Drahtes bemerkt; um diese Zeit war in Ungarn ein Erdbeben.

1847 Dec. 11 Vormittags 10^h sehr dichter Nebel, dann heiter bis gegen 3^h Nachmittags, wo sich eine sehr tiefliegende, ungemein dichte Nebelwolke von Norden her in den Stadtgraben zog, dann auf die Thorbrücken hob, endlich durch die Thore in die innere Stadt trat, und von 6^h bis nach 7^h die Strassen beinahe ungangbar machte.

Am 6. Februar 1848 stellte sich bei einer Temperatur von — 7° des Morgens ein heftiger Regen ein, der bei nur sehr langsam steigendem Thermometer den ganzen Tag über anhielt. Die Folge davon war ein Glatteis, wie es an Gefährlichkeit und allgemeiner Verbreitung seit Menschengedenken nicht vorgekommen. Erst gegen 9^h Abends überstieg die Temperatur den Nullpunkt. Zugleich sprang der bis dahin wehende Südwind nach West über, und das Barometer stand um 0.″2 tiefer als des Morgens; in weniger als einer Stunde war die dicke Eiskruste überall verschwunden.

Am 8. Juni 1848 entlud sich nach 2^h Mittags ein Gewitter aus NW. mit einem sehr heftigen Hagel, dessen Körner die ungewöhnliche Grösse von 1 Zoll im Durchmesser erreichten.

1849 Januar 16. Um 8^h Eisstoss und Ueberschwemmung.

1849. Der am 23. Januar Abends eingetretene Sturm dauerte die ganze darauffolgende Nacht, und wuchs endlich im Laufe des nächsten

Tages zu einem förmlichen Orkan, der in dieser Heftigkeit wohl seit mehreren Jahrzehenden in Wien sich nicht ereignet hatte, und durch mehr als 12 Stunden mit gleicher Stärke wüthete; erst im Vormittage des 25. nahm er nach und nach ab, bis er endlich gegen 2^h Abends sich beinahe völlig gelegt hatte. Wenige Häuser kamen ohne Beschädigungen an Fenstern, Dachungen und Schornsteinen durch, viele wurden noch härter mitgenommen. In diesem Jahrhunderte mögen nur die Orkane von 1801 und 1829 sich irgend mit dieser Erscheinung vergleichen lassen.

1850. Der Monat Jänner, in welchem an demselben Tage (22. Jänner) der höchste Barometerstand und die kleinste Temperatur des ganzen Jahres zusammentrafen, war nicht blos durch die nahe Berührung der meteorologischen Extreme, sondern auch in der Weise merkwürdig, dass in einem Zeitraume von etwa 3 Tagen (22.—24.) mehrere Erscheinungen eintraten, die in den meteorologischen Annalen der Sternwarte Wiens in ihrer Art und in ihrem fast gleichzeitigen Zusammentreffen einzig dastehen: Gewitter (am 23.), verbunden mit Nordweststurm und Schneegestöber, Regen, Thauwetter und farbiger Mondhof (am 24.), eine Aenderung der Temperatur von 25.°2, des Barometers von 1.4 Zoll. Auch erreichte die Temperatur in denselben Tagen einen für Wien unerhörten Stand von — 20.°4 und der Wind machte zwischen dem 19. und 23. alle Richtungen der Rose durch. Ferner zeichnete sich dieser Monat durch häufigen Schneefall aus, der besonders in der erwähnten Periode so gross war, dass der Schnee in der Stadt eine seit Menschengedenken nicht vorgekommene Höhe erreichte und zum Theile die Passage unmöglich machte. Der Schneefall, der unter Begleitung eines Gewitters auftrat, war durch kleine runde schlossenartige Flocken ausgezeichnet. Den höchsten Stand im ganzen Jahre erreichte das Thermometer am 23. August mit +26.°5, wodurch sich die Aenderung der Temperatur im ganzen Jahre mit 46.°9 ebenfalls als einzig in den Annalen Wiens darstellt. (Wien. Zeit. vom 27. Jänner 1850 und Jänner 1851.) Aehnliche eigenthümliche Temperatur- und Barometergänge finden sich Ende Jänner 1846, nur nicht in solchem Masse.

1851 Mai 18. In Folge des sehr bedeutenden Regens schwollen alle Gebirgsbäche und Flüsse so an, dass eine bedeutende Ueberschwemmung eintrat, und die Wien beinahe alle Brücken niederriss.

Wir schliessen dieses Werk mit dem Wunsche, dass es von den Meteorologen freundlich aufgenommen und den Umständen billige Rücksicht getragen werde, unter welchen die hier bekannt gemachten

Beobachtungen zu Stande kamen. Wir sind uns mancher Unvollkommenheiten derselben sehr wohl bewusst, die zum Theil der Zeit ankleben, aus welcher unsere Notirungen stammen, zum Theil daher rühren, dass die Sternwarte diese Aufgabe immer als eine Nebenarbeit behandeln musste, zu deren vollständiger Durchführung die vorhandenen Kräfte nicht genügten, hoffen aber, dass dessenungeachtet die Wissenschaft aus dieser Publication, welche seit 1856 in den Annalen der Sternwarte Jahr für Jahr ergänzt wird, nicht unbedeutenden Nutzen ziehen könne.

Wien, den 12. Mai 1866.

C. v. Littrow.
